GitHub\er_diagram.md

GROUP 4

JOB_PARTS:

Uses `part_id` and `job_id` as a combined primary key to work as a junction table. M:M relation, several parts for several repair jobs.

REPAIR_JOBS:

Removed `customer_name` since it already exists in `CUSTOMERS` `device_brand` is removed because it already exists in `device_id` Quantity is `NULL`, part quantity can be 0.

CUSTOMER:

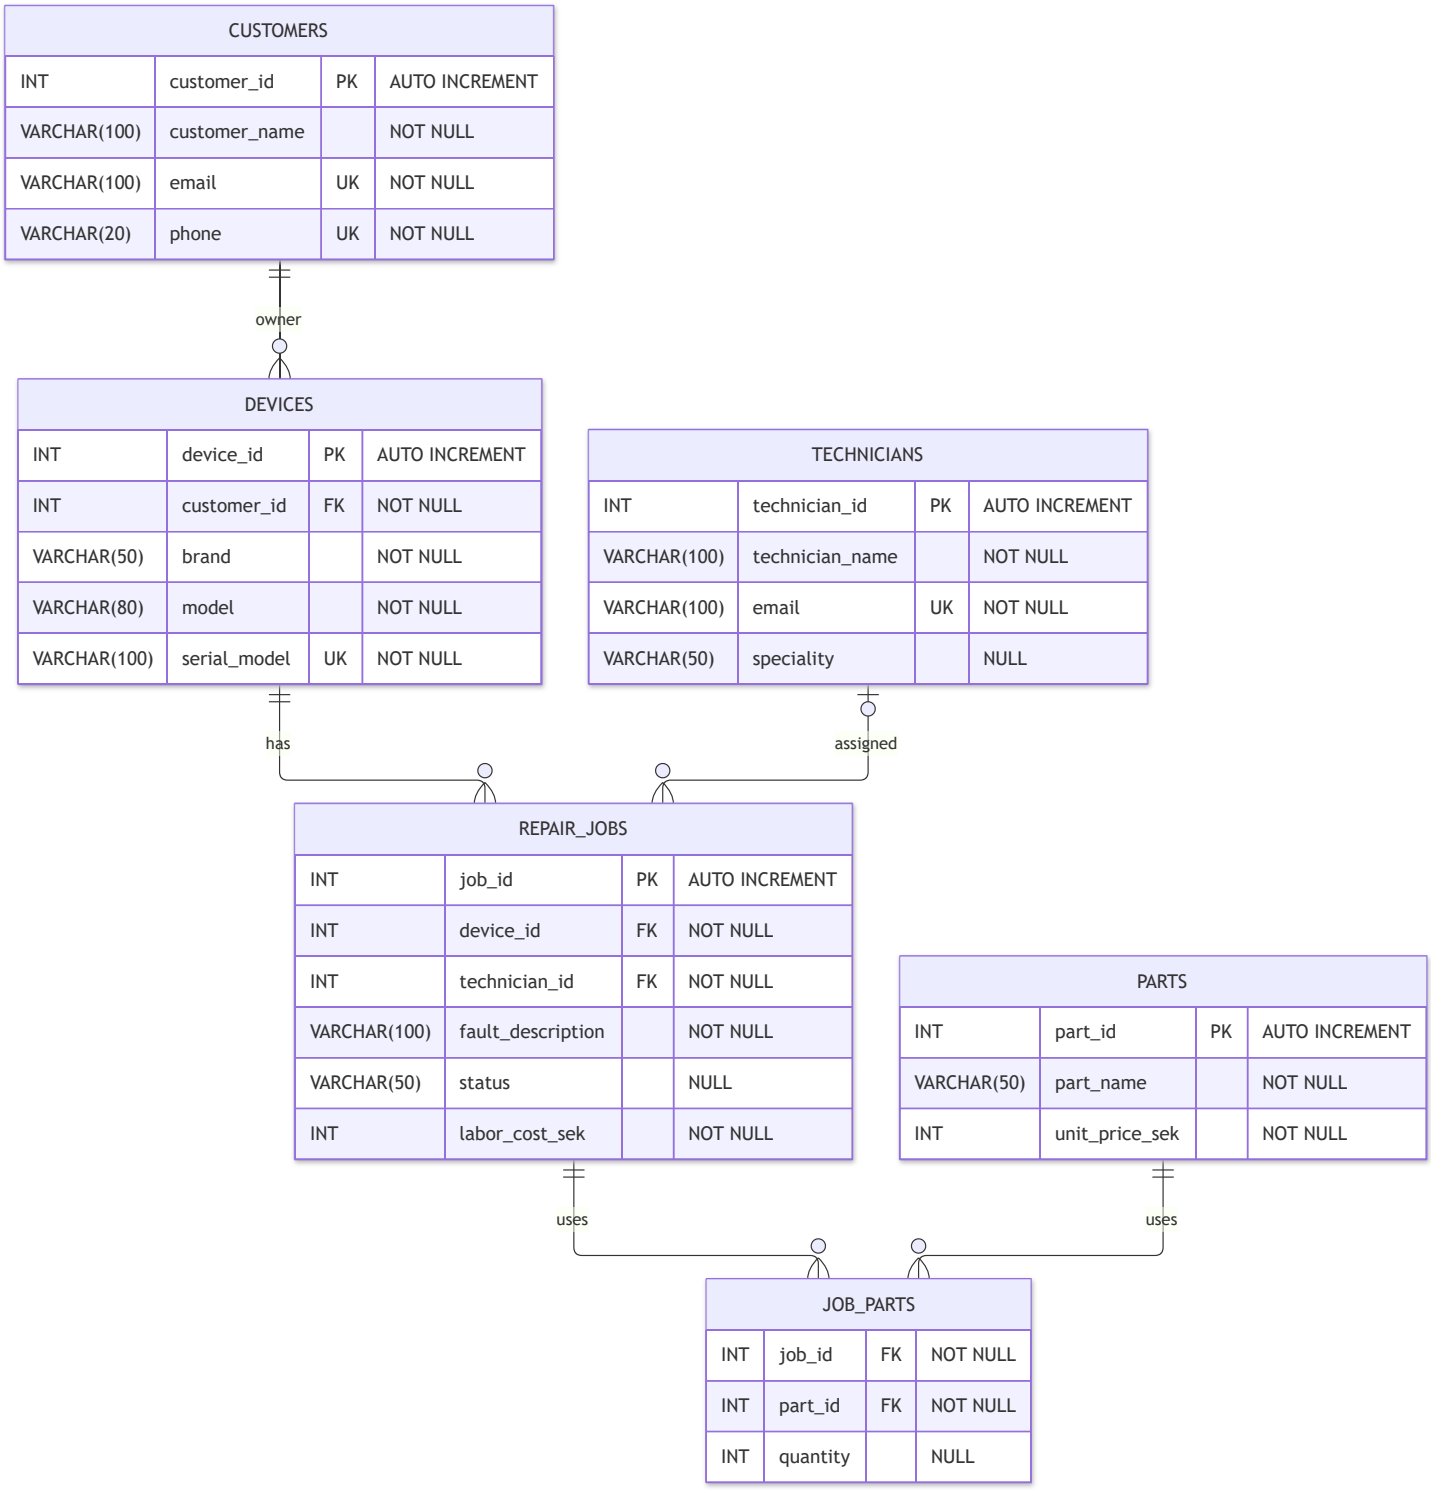

Tried adding first och last name but decided to use `customer_name` for now. Can be discussed with the company. Removed city-column with the reasoning that it is unnecessary, should probably be discussed with the company. `phone` and `email` is `UNIQUE` to be different for every customer. 1:M relation, one customer can have several devices.

TECHNICIANS:

Tried adding first och last name but decided to use `customer_name` for now. Can be discussed with the company. 1:M relation, one technician can have multiple `repair_jobs`. Email is `UNIQUE`. Specialty is `NULL`, a technician doesn't need a specialty.

DEVICES:

serial_model is `UNIQUE`. 1:M Relation, one device can have several repair jobs.
